1 Usage

1.1 Introduction

Dual clock block RAM for any FPGA target. Includes a byte enable for selecting bytes to write from the bus.

1.2 Dependencies

The following are the dependencies of the cores.

- fusesoc 2.X
- iverilog (simulation)
- cocotb (simulation)

1.2.1 fusesoc_info Dependencies

- dep
 - AFRL:utility:helper:1.0.0
- dep_tb
 - AFRL:simulation:clock_stimulator
 - AFRL:utility:sim_helper

1.3 In a Project

Connect the device using the read write signals see 5 for details

2 Architecture

This core is made up of a single module.

- **ft245_sync_to_axis** Interface AXIS to F245 device (see core for documentation).

This core has 2 always blocks that are sensitive to the positive clock edge.

- **Produce Data** Takes write input data and stores it in RAM at a specified address. BE will filter out bytes if the corresponding bits not set to active high.
- **Consume Data** Read data from RAM at a specified address and output over read interface.

Please see 5 for information on read/write interface ports.

3 Building

The DC block RAM is written in Verilog 2001. It should synthesize in any modern FPGA software. The core comes as a fusesoc packaged core and can be included in any other core. Be sure to make sure you have met the dependencies listed in the previous section.

3.1 fusesoc

Fusesoc is a system for building FPGA software without relying on the internal project management of the tool. Avoiding vendor lock in to Vivado or Quartus. These cores, when included in a project, can be easily integrated and targets created based upon the end developer needs. The core by itself is not a part of a system and should be integrated into a fusesoc based system. Simulations are setup to use fusesoc and are a part of its targets.

3.2 Source Files

3.2.1 fusesoc_info File List

- src
 - Type: verilogSource
 - src/dc_block_ram.v
- tb
 - 'tb/tb_fifo.v': 'file_type': 'verilogSource'

3.3 Targets

3.3.1 fusesoc_info Targets

- default
 - Info: Default for IP intergration.
 - src
 - dep
- sim
 - Info: Default for IP intergration.
 - src
 - dep
 - tb
 - dep_tb

3.4 Directory Guide

Below highlights important folders from the root of the directory.

1. **docs** Contains all documentation related to this project.
 - **manual** Contains user manual and github page that are generated from the latex sources.
2. **src** Contains source files for the core
3. **tb** Contains test bench files for iverilog and cocotb
 - **cocotb** testbench files

4 Simulation

There are a few different simulations that can be run for this core.

4.1 iverilog

iverilog is used for simple test benches for quick verification, visually, of the core.

4.2 cocotb

Future simulations will use cocotb. This feature is not yet implemented.

5 Module Documentation

- **dc_block_ram** Generic dual clock block RAM

The next sections document the module in great detail.

dc_block_ram.v

dc_block_ram

```
module dc_block_ram #(
    parameter
    RAM_DEPTH
    =
    1,
    parameter
    BYTE_WIDTH
    =
    1,
    parameter
    ADDR_WIDTH
```

```

    =
    1,
    parameter
    HEX_FILE
    =
    "",
    parameter
    RAM_TYPE
    =
    "block"
) ( input rd_clk, input rd_rstn, input rd_en, output [(BYTE_WIDTH*8)-1:0]

```

Generic Dual Port RAM

Parameters

RAM_DEPTH <small>parameter</small>	Number of words using the size of BYTE_WIDTH.
BYTE_WIDTH <small>parameter</small>	Width of the data bus in bytes.
ADDR_WIDTH <small>parameter</small>	Width of the address bus in bits.
HEX_FILE <small>parameter</small>	Read a hex value text file as the initial state of the RAM.
RAM_TYPE <small>parameter</small>	Used to set the ram_style attribute.

Ports

rd_clk	Read clock positive edge
rd_rstn	Read reset active low
rd_en	Read enable active high
rd_data	Read data output
rd_addr	Read data address select
wr_clk	Write clock positive edge
wr_rstn	Write reset active low
wr_en	Write enable active high
wr_ben	Write byte enable, each bit represents one byte of write data.
wr_data	Write data input
wr_addr	Write data address select
